

Humanity Protocol (\$H)

Deep Research Brief — Company, Token, and Recent Events (Last 6 Months)
Prepared for Partnership Evaluation — Humanity Scanner / Hardware Devices

Prepared August 17, 2026 | Internal — Confidential

1. Executive Summary

Humanity Protocol (HP) is a Hong Kong-based decentralized identity company building "Proof of Humanity" / "Proof of Trust" infrastructure using palm-biometric verification and zero-knowledge proofs. It has raised ~\$50M (Pantera, Jump Crypto, Animoca, Polygon, Kingsway Capital et al.) at a peak \$1.1B FDV, issued 8M+ Human IDs, and runs a native token (\$H, ERC-20, 10B fixed supply). The last six months have been volatile: a \$36M security breach in June 2026 forced a full token migration, followed by a strategic pivot away from pure "Proof-of-Personhood" toward a broader enterprise "Proof of Trust" identity/credentialing platform, plus a stated pivot into enterprise AI products. Despite the hack, HP continues to ship integrations (Mastercard, Fireblocks, Kaito) and is doubling down on its hardware layer — the **Humanity Scanner** — as the backbone of a DePIN (Decentralized Physical Infrastructure Network) node/device strategy. This is the most relevant thread for a device-partnership pitch.

2. Company Snapshot

Item	Detail
Founded	2023, Hong Kong
Founder	Terence Kwok
Core product	Human ID — palm-biometric + ZK proof identity credential
Total funding	~\$50M across 3 rounds (Seed rounds Feb 2024 undisclosed \$1B val.; May 2024 \$30M led by Kingsway Capital w/ Animoca, Polygon, Hashed, Shima Capital; Jan 2025 \$20M led by Pantera Capital & Jump Crypto at \$1.1B FDV)
Users	8M+ Human IDs issued (per company, Feb 2026 statement)
Strategic shift	Feb 2026: rebranded core framework from "Proof-of-Personhood" to "Proof of Trust" — broader verifiable-credential platform (KYC, age, residency, employment, asset ownership) rather than just uniqueness verification
July 2026 pivot	Founder confirmed repositioning toward enterprise AI products, leveraging existing identity/credential security tech, accelerated by the June hack

3. \$H Token

3.1 Tokenomics

- ERC-20, fixed supply 10,000,000,000 \$H
- Allocation highlights: Ecosystem Fund 24%, Foundation Operations Treasury 12% (0 cliff, 48mo vest, 50% unlocked at TGE), Identity Verification Rewards 18% (6mo cliff, 42mo vest), Human Institute Strategic Reserves 5% (12mo cliff, 18mo vest)
- Utility: pays zkProofer/validator node rewards, staking for governance, identity-verification fee settlement, and powers "Fairdrops" — a Sybil-resistant airdrop distribution tool HP licenses to other Web3 projects
- Launched on exchanges June 25, 2025 following a "Fairdrop" (world's first bot-resistant airdrop, gated by Human ID verification)

3.2 Price Action & Key Event: The June 2026 Exploit

June 8, 2026 — \$36M security breach. Attackers compromised a company director's laptop via a phishing email spoofing South Korean exchange Bithumb (fake "token lockup schedule" attachment). Malware granted remote access, exfiltrating MetaMask credentials/private keys. ~141M H tokens were drained from an Ethereum bridge and ~100M additional H were fraudulently minted on BNB Chain. Security firm Quantstamp attributed the malware signing certificate and tradecraft to patterns "characteristic of DPRK intrusions" (North Korea-linked). H price fell ~73–90% from its June 2, 2026 all-time high of \$0.8537.

- **Recovery plan (June 16, 2026):** Old H contracts on Ethereum, BNB Chain, and Humanity Mainnet sunsetted. New audited ERC-20 contract deployed (0xE76c...5dE1); 1:1 airdrop to pre-hack holders based on a snapshot taken June 8, 17:25:35 UTC, excluding attacker-linked wallets. A separate Compensation Fund covers LP exposure and post-snapshot buyers.
- **Mainnet relaunch:** Humanity Mainnet planned to relaunch with new \$H as native gas token; rollout of decentralized verifier nodes positioned as the next major 2026 milestone.
- **Current market data (mid-Aug 2026, varies by source/timing):** Price roughly \$0.06–\$0.16, market cap ~\$150M–\$310M depending on source and snapshot time; circulating supply ~1.95–2B H (~20% of max supply); Mkt Cap/FDV ≈ 0.2 . A scheduled token unlock is due ~Aug 25, 2026.
- **Aug 15–17, 2026 — whale activity:** Santiment reported a 500% weekly spike in large-holder (\$100k+) transfers; price rallied ~30–38% in 24-48h, reclaiming the 20- and 50-day moving averages, though analysts flag the new contract as "owner-controllable" and note the attacker's wallets are still periodically moving stolen tokens — an overhang risk.

4. Ecosystem & Partnerships (Trailing ~9-12 Months)

Date	Partner / Deal	Nature
2025	Kaito	Kaito became an official Identity Validator issuing "Yapper Credentials" (Inner CT / Emerging CT / Yapper tiers) to crypto-native users, tied to bonus airdrop allocations (+50%/+25%)
Nov 2025	Mastercard	"Mastercard x Humanity" — open finance integration; Human ID users verify income/assets/financial credentials via ZK proofs for KYC/credit/loans, reusable across banks/exchanges/DeFi. Rolling out first in the U.S.
Jun 2026	Moongate (acquisition)	Acquired Web3 event-ticketing/credentialing platform (partners incl. TOKEN2049, Binance Blockchain Week, ETHDenver) to push Human ID into real-world event access/ticketing/loyalty. Moongate operates under its own brand, integrated into HP ecosystem.
Feb 2026	Fireblocks	Institutional custody/treasury integration — 2,400+ institutions can now custody and transact \$H and HP-native assets natively via Fireblocks (one of 130+ chains supported)
Feb 2026	"Proof of Trust" rebrand	Platform broadened from pure personhood verification to a generalized, privacy-preserving credential/attestation layer; developer APIs released for non-blockchain apps (social platforms, KYC, RWA ownership)
Ongoing	University Partner Program	Blockchain clubs at Cambridge, Yale, etc. operate identity-scanning initiatives on campus — a template for a "local operator" distribution model

5. Hardware Layer: Humanity Scanners & DePIN Strategy (Primary

Partnership Angle)

This is the thread most directly relevant to a devices partnership pitch:

- **What it is:** The Humanity Scanner is a dedicated biometric hardware device using infrared light to capture palm-vein patterns (distinct from — and more secure/harder to spoof than — the surface palm-print capture done via the mobile app). It can operate as a standalone terminal or attach to a smartphone.
- **Rollout model:** First scanner batch was shipped to "operating partners" globally (not sold directly to consumers at scale) to power local enrollment events; interested parties apply via a partner/interest form and can also "order a device" directly.
- **Phase 2 — DePIN network:** HP's own docs (whitepaper + gitbook) describe an explicit roadmap to convert Scanners into DePIN nodes — i.e., node operators who host scanners

are meant to eventually earn from more than verification alone (fairdrops, loyalty programs, "decentralized computing endeavors"). This is HP's own stated device-monetization thesis and gives an opening to pitch complementary hardware, node-operator tooling, or distribution/manufacturing support.

- **Enterprise integration path:** Separate from consumer hardware, HP offers a developer/enterprise API for verification without owning a scanner ("Partner with us" / "Schedule a call" CTAs on humanity.org/enterprises) — useful if the angle is software-only integration rather than physical devices.
- **Event/access use case (via Moongate):** Palm-based check-in is explicitly positioned as a wristband/lanyard replacement for concerts, conferences, festivals — a concrete vertical if your device or hardware overlaps with event tech, access control, or ticketing.

Angle worth testing with them: HP has publicly said it wants to "meet people where they are in the real world" (Moongate rationale) and is trying to scale physical verification touchpoints (university partner program, event partnerships, DePIN node operators). A pitch that offers to manufacture, distribute, co-brand, or expand the footprint of scanner-class hardware — or to integrate their palm-vein verification into an existing device/venue network — lines up with where they say they're investing next (Phase 2 DePIN, real-world/event rollout, University Partner Program as a channel template).

6. Risks & Diligence Flags

- **Security track record:** \$36M breach in June 2026 attributed to suspected DPRK actors via spear-phishing of an executive — raises questions about HP's internal opsec that should be probed before any integration involving shared credentials, funds, or device firmware.
- **New contract flagged "owner-controllable":** Some analysts note the post-hack ERC-20 contract retains admin/owner controls — worth understanding governance/upgrade risk if a partnership involves token-based incentives.
- **Token volatility / overhang:** Down ~90% from ATH, attacker wallets still periodically moving stolen H, and a scheduled unlock (~Aug 25, 2026) add near-term price/sentiment risk — relevant if deal terms involve \$H as consideration.
- **Strategic direction in flux:** Two pivots in ~6 months (Proof-of-Personhood → Proof of Trust, then a stated AI-enterprise pivot) suggest the roadmap is still being actively reshaped post-hack — get current-state confirmation directly from HP rather than relying on older collateral.

Recommendation: Proceed with outreach. The hardware/DePIN thread gives a legitimate, well-timed hook — HP is actively trying to expand scanner distribution and just acquired an events/access company (Moongate) to do it. Lead with the device-distribution/integration angle rather than a token or treasury angle, given the recent hack and token volatility. Suggest starting with their enterprise "Partner with us" / "Schedule a call" channel and, separately, direct outreach to Terence Kwok or BD lead — I can draft that outreach email for your review once you confirm which device/integration you want to lead with.
